

FARGO Connect PHP SDK v1.7.0 Release Notes:

New features and enhancements

- **IMPORTANT** - The 1.7.0 SDK release includes new features that require HID FARGO Connect 2020 R2 (version 1.7.8) or later. Please ensure that the correct version of FARGO Connect is available before deploying applications built using this SDK release.
- Added browser-based class documentation generated from the PHP source code comments. The documentation is located in “phpdoc” folder of the SDK distribution archive.
- Added properties **deviceUniqueld** and **LocationUniqueld** to the Job class to identify the Console and its location.
- Added properties **jobDeletionRequested** and **jobDeletionMessage** to the **Job** class to support the job deletion feature which is currently in development. A formal announcement will be made when job deletion is available.
- Added method **getJobImageResource** to the **JobApi** to support retrieval of optional images of the card front and/or back rendered by the Console. A **CardRenderOption** class was added containing the constants needed to configure this feature during job submission.
- Added property **jobResources** to the **Job** class to list the available resources attached to the job results. This feature is used to obtain the values needed to call the **getJobImageResource** method when the card image rendering feature is enabled.
- Updated the SDK to use the new Core Services REST API v1.3 added in the FARGO Connect 2020 R2 release.
